

VanRik AGRO group has implemented a project on the commercial cultivation of blueberries, raspberries, blackberries. The program initially was planted for 147,000 seedlings of blueberry. Plantation has been specifically designed to ensure the highest quality berries. The company is planning expansion to 400-500 hectares of plantation during 3 years. All varieties of berries are widely used in the world of industrial production of berries and are in demand. Due to the fact that berry collection technology requires rapid packaging

and cooling, modern packing-refrigerating and processing plant was be build on the plantation.

Manufactured products are intended for sale on the local market and for export as fresh, frozen and in the form of the final product (jam, confiture). Besides, technology of industrial production of blueberries requires a large bee farms (3-4 hives per hectare). Productivity of blueberries - 80-100 kg of honey per hectare. Our company has commissioned a laboratory in Batumi to produce planting material by micro cloning method, which will allow us to expand the plantation using our own plants, not to depend on foreign suppliers, involve local highly qualified personnel and train the youth in advanced technology.
